

Project Design Phase

Proposed Solution Template

Date	9 September 2026
Team ID	Individual
Name	Noshma Chowdary Uppuluri
Project Name	Employee Raise Issue Management System using ServiceNow
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Employees regularly face workplace / IT issues such as network (e.g. VPN), hardware (e.g. laptop, server), software and access (e.g. forgotten password) problems. Without a centralised, structured way to report them, issues are raised through scattered informal channels, are often incomplete (missing category, requester or description) and are not captured as dedicated records, which makes them difficult to track and manage. Problem to be solved: provide employees with a single ServiceNow portal where an issue can be raised through a structured form and stored as a trackable Employee Issue record.
2.	Idea / Solution description	Employee Raise Issue Management System using ServiceNow – a custom ServiceNow application delivered through an Employee Center / Service Portal. Flow: Employee → Employee Center portal → Raise an Issue → Raise Employee Issue → enter Requester, Category, Subcategory, State and Short Description (attachment if required) → Submit → Employee Issue record / ticket created (e.g. EMP0001004) → record can be tracked / managed in ServiceNow. Implemented components: • Custom application and custom Employee Raise Issue table (Requester, Category, Subcategory, State, Short Description and other project fields). • Record Producer “Raise Employee Issue” with five variables mapped to the table fields (Requester – reference to sys_user; Category, Subcategory, State – multiple choice; Short Description – single-line text). • Category: Network, Software, Hardware, Access. Subcategory: VPN, Laptop, Server, Forgot Password. State: New, In Progress, Resolved, Closed. • UI policies / dependencies for category / subcategory and field behaviour on the Employee Issue form. • Employee Center-based Service Portal (https://dev402706.service-now.com/employee_request) with Search, Raise an Issue, Raise Ticket, Quick Links, My Active Items and Recommended for You. • Custom Commercial Services widget (“Our Commercial Services”) built with HTML and CSS/SCSS. • GitHub source control: SriyaRam12/employee-issue-management-servicenow. Current scope: issue creation and record management. The system does not automatically resolve, assign or escalate issues, and it is not AI-based.
3.	Novelty / Uniqueness	The novelty lies in a tailored, end-to-end combination of ServiceNow platform features for this use case – not in AI or automation: • Purpose-built custom application and dedicated Employee Raise Issue table with its own ticket numbers (e.g. EMP0001004). • Structured intake: Record Producer variables mapped one-to-one to table fields, with predefined choices for Category, Subcategory and State instead of free text.

S.No.	Parameter	Description
		- Employee Center portal customised with a custom Commercial Services widget (own HTML and CSS/SCSS design: gradient background, rounded card, check-mark list) placed alongside the issue-raising entry point. - Application committed to GitHub through ServiceNow's source-control integration for versioning.
4.	Social Impact / Customer Satisfaction	- One clear place for employees to report issues, reducing confusion about how and where to raise them. - A ticket record is created on submission (test record EMP0001004), so the employee has evidence that the issue has been logged. - Consistent categories (Network, Software, Hardware, Access) let support staff understand the type of issue from the record. - The Commercial Services widget shows the messages "24/7 Customer Support", "Faster Issue Resolution", "Transparent Tracking" and "Secure & Reliable". These are informational statements on the widget; the current version does not automate support or resolution. Benefits above are design-level expectations. No quantitative satisfaction measurement is included in the current evidence.
5.	Business Model (Revenue Model)	This is an academic / internal-use ServiceNow application. Conceptual value (not implemented): as an internal service-management tool, the value comes from time saved and better visibility of employee issues rather than direct sales. Platform licensing would be the responsibility of the organisation that owns the ServiceNow instance. No revenue model has been implemented.
6.	Scalability of the Solution	Current status: functionally tested with test submissions on the demo instance (dev402706). No load or performance testing has been performed. Scalability potential: - Built on the cloud-based ServiceNow platform; additional issues are stored as further records in the same table through the same Record Producer. - Extensible design: new categories, subcategories or fields can be added to the table and Record Producer, and the widget can be reused or restyled on other portal pages. - GitHub-connected source control supports versioned changes and can help with moving the application to other instances. - Future Enhancements (assignment rules, SLA management, notifications, Flow Designer workflow, dashboards and analytics) would extend the solution operationally.

Implemented (current version)	Future Enhancement (not implemented)
- Custom ServiceNow application - Custom Employee Raise Issue table - Record Producer "Raise Employee Issue" with 5 mapped variables - UI policies / dependencies on the Employee Issue form - Employee Center-based Service Portal with Raise an Issue - Custom Commercial Services widget (HTML, CSS/SCSS) - GitHub source-control commit - Successful test record (EMP0001004)	- Automatic assignment to support groups - Assignment rules - Automated notifications - SLA management - Flow Designer workflow - Automated state transitions - Resolution notes - Knowledge article recommendations - Dashboards and analytics - Approval workflow - Automated escalation
